Lab Session 08: **STACK, IT'S OPERATION & NESTED PROCEDURES**

Objectives:

- Runtime Stack
- Push instruction
- Pop instruction
- PROC Directive
- Call & Ret Instructions
- Nested Procedures

Stack:

- LIFO (Last-In, First-Out) data structure.
- push/ pop operations
- You probably have had experiences on implementing it in high-level languages.
- Here, we concentrate on runtime stack, directly supported by hardware in the CPU. It is essential for calling and returning from procedures.

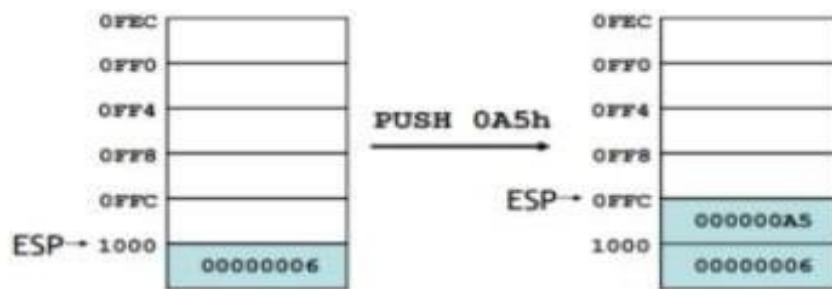

Runtime Stack:

- Managed by the CPU, using two registers
- SS (stack segment)
- ESP (stack pointer): point the last value to be added to, or pushed on, the top of stack usually modified by instructions: **CALL, RET, PUSH and POP**

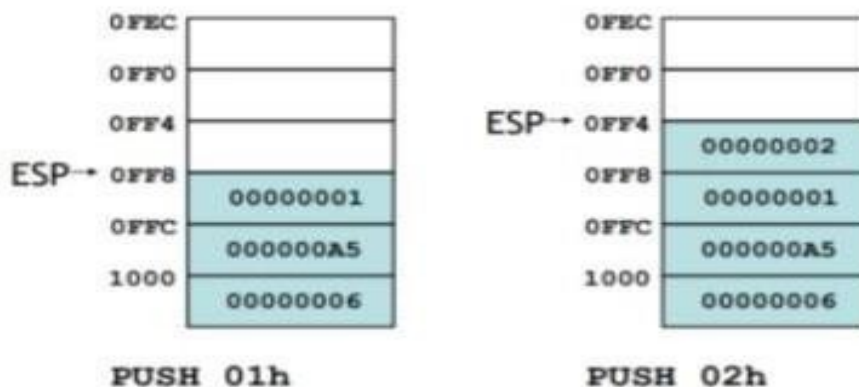

Push Operation

A 32-bit push operation decrements the stack pointer by 4 and copies a value into the location in the stack pointed to by the stack pointer.

- The same stack after pushing two more integers:

Pop Operation

A pop operation removes a value from the stack. After the value is popped from the stack, the stack pointer is incremented (by the stack element size) to point to the next- highest location in the stack. It copies value at stack [ESP] into a register or variable.

PUSH and POP instructions:**PUSH syntax:**

- PUSH r/m16
- PUSH r/m32
- PUSH imm32

POP syntax:

- POP r/m16
- POP r/m32

PUSHED and POPED Instructions

The MOV instruction cannot be used to copy the flags to a variable.

The PUSHFD instruction pushes the 32-bit EFLAGS register on the stack, and POPFD pops the stack into EFLAGS:

pushfd
popfd

Example 01: (Stack and nested loops.)

```
Include Irvine32.inc
.code
main proc
mov ebx,0
mov ecx,5
L1:
push ecx
mov ecx, 10
L2:
inc ebx
mov eax,ebx
call WriteDec
loop L2
call Crlf
pop ecx
loop L1

call DumpRegs
exit
main ENDP
END main
```

Example 02:(displays the product of three integers through a stack)

```

Include Irvine32.inc
.data
    multp DWORD 2
.code
main proc
    mov eax, 1
    mov ecx, 3
L1:
    PUSH multp
    ADD multp, 2
    LOOP L1
    mov ecx, 3
L2:
    POP ebx
    MUL ebx      ;eax value multiply
    LOOP L2

    call  DumpRegs
    exit
main ENDP
END main

```

Example 03:(To find the largest number through a stack)

```

Include Irvine32.inc
.code
main proc
    PUSH 5
    PUSH 7
    PUSH 3
    PUSH 2
    MOV eax, 0          ;eax is the largest
    MOV ecx, 4

L1:
    POP edx
    CMP edx, eax
    JL SET
    MOV eax, edx
    SET:
    LOOP L1
    call  DumpRegs
    exit
main ENDP
END main

```

Procedures

- Procedures or subroutines are very important in assembly language, as the assembly language programs tend to be large in size.
- Procedures are identified by a name. Following this name, the body of the procedure is described which performs a well-defined job.
- End of the procedure is indicated by a return statement.

Example 04:

```
INCLUDE Irvine32.inc
INTEGER_COUNT = 3
.data
str1 BYTE "Enter a signed integer: ",0
str2 BYTE "The sum of the integers is: ",0
array DWORD INTEGER_COUNT DUP(?)
.code
main PROC
call Clrscr
mov esi,OFFSET array
mov ecx,INTEGER_COUNT
call PromptForIntegers
call ArraySum
call DisplaySum
exit
main ENDP
```

```
PromptForIntegers PROC USES ecx edx esi
mov edx,OFFSET str1 ; "Enter a signed integer"
L1: call WriteString ; display string
call ReadInt; read integer into EAX
call Crlf ; go to next output line
mov [esi],eax ; store in array
add esi,TYPE DWORD ; next integer
loop L1
ret
PromptForIntegers ENDP
```

```
ArraySum PROC USES esi ecx
mov eax,0 ; set the sum to zero
L1: add eax,[esi] ; add each integer to sum
add esi,TYPE DWORD ; point to next integer
loop L1 ; repeat for array size
```

```
ret ; sum is in EAX
ArraySum ENDP
```

```
DisplaySum PROC USES edx
mov edx,OFFSET str2
call WriteString
call WriteInt      ; display EAX
call CrLf
ret
DisplaySum ENDP
END main
```

Nested Procedure Calls

A nested procedure call occurs when a called procedure calls another procedure before the first procedure returns.

Example 05:

```
Include Irvine32.inc
.data
    var1    DWORD 5
    var2    DWORD 6
.code
main proc
call AddTwo
call dumpregs
call writeint
call crlf
```

```
exit
main ENDP

AddTwo PROC
Mov eax,var1
Mov ebx,var2
Add eax,var2

Call AddTwo1
Ret
Addtwo ENDP

AddTwo1 PROC
Mov ecx,var1
Mov edx,var2
Add ecx, var2
Call writeint
Ret
AddTwo1 ENDP
END main
```

EXERCISES

Task#1:

Take an array of 10 numbers move word-type of data into another empty array using stack push and pop technique.

Task#2

Write a program which displays the addition of three integers through a stack.

Task#3

Write a program having nested procedures are used to calculate the total sum of 2 arrays (each array having 5-elements). The sum of 1-array in 1st procedure and in 2nd procedure have sum of 2-array. And the 3rd procedure added the results of both.

Task#4

Print the following pattern using a function call in which number of columns is pass through a variable.

```
*
**
***
****
*****
```

Task#5

Print the following pattern using a function call in which number of columns is pass through a variable.

```
A
BC DEF
GHIJ
KLMN
```

Task#6

Write a function that asks the user for a number n and prints the sum of the numbers 1 to n.

Task#7

Write a program to calculate the factorial of the number entered by the user.
